NOTE:
The convey length should be from upstream to downstream inside box.
This length may also be used as Pay Item.
Using hydraulic length, from node center to node center, may result in profile error, and this length should not be used as Pay Item.

SUMMARY OF STORM DRAIN STRUCTURE QUANTITIES

NOTE:
The convey length should be from upstream to downstream inside box.
This length may also be used as Pay Item.
Using hydraulic length, from node center to node center, may result in profile error,
and this length should not be used as Pay Item.

SUMMARY OF STORM DRAIN STRUCTURE QUANTITIES

NOTE:
The convey length should be from upstream to downstream inside box.
This length may also be used as Pay Item.
Using hydraulic length, from node center to node center, may result in profile error,
and this length should not be used as Pay Item.

NOTES:

1. SEE PAVEMENT AND STORM SEWER SHEETS FOR MORE INFORMATION.

2. ALL STORM SEWER LENGTHS ARE BASED ON CENTER OF STRUCTURE (HYDRAULIC LENGTH) EXCEPT AT BOX CULVERT LATERALS WHERE INSIDE EDGE OF BOX CULVERT OR JUNCTION BOX IS LIMIT OF PIPE.

3. COST FOR CONNECTION TO EXISTING STORM SEWERS WILL BE SUBSIDIARY TO STRUCTURE.

4. VERIFY LOCATION OF EXISTING UTILITIES PRIOR TO CONSTRUCTION.

5. TAILWATER FOR 2-YR ANALYSIS, SYSTEM AB, IS EQUIVALENT TO THE EXISTING TOP OF BOX OF THE EXISTING 5'X9'RCB UNDERNEATH THE IH-10 WESTBOUND FRONTAGE ROAD, 72.67'.

6. THE 2-24" RCP OUTFALL, RUN 15, 33" RESTRICTOR, RUN 253, AND 36" POND OUTFALL, RUNS 110, 401 AND 402, WERE MODELED WITH EQUIVALENT PIPE SIZES TO MATCH HEAD LOSS OF ACTUAL PIPES IN SYSTEM AB.

7. ADDITIONAL FLOWS ARE INPUT DIVERSIONS FROM SPILLERS LANE TO LUMPKIN ROAD(AM27 TO AM37A), FROM LUMPKIN INTO THE WESTVIEW BASIN (AM38A TO A44), FROM LUMPKIN TO THE 7'x5'RCB(AM56), FROM THE 24"RCP HCC SYSTEM TO LUMPKIN ROAD TO MATCH 2D RESULTS AND/OR BALANCE HGL IN A LOOPED SYSTEM (B01 TO BM13 & B02 TO BM08), AND FROM THE EXIST 5'X9' RCB AT IH-10 FRONTAGE ROAD WEST (CM04 TO CM06).

8. RUN 111 REPRESENTS IMPACT OF DETENTION BASIN. PEAK FLOW EXITS AT NODE AM38C (REDUCED BY -109.47CFS). THEN 60% OF PEAK FLOW (65.68CFS) RE-ENTERS AT A44, WHICH REPRESENTS THE THE 36"RCP OUTFALL OF THE BASIN.

NOTES:

1. SEE PAVEMENT AND STORM SEWER SHEETS FOR MORE INFORMATION.

2. ALL STORM SEWER LENGTHS ARE BASED ON CENTER OF STRUCTURE (HYDRAULIC LENGTH) EXCEPT AT BOX CULVERT LATERALS WHERE INSIDE EDGE OF BOX CULVERT OR JUNCTION BOX IS LIMIT OF PIPE.

3. COST FOR CONNECTION TO EXISTING STORM SEWERS WILL BE SUBSIDIARY TO STRUCTURE.

4. VERIFY LOCATION OF EXISTING UTILITIES PRIOR TO CONSTRUCTION.

5. TAILWATER FOR 2-YR ANALYSIS, SYSTEM AB, IS EQUIVALENT TO THE EXISTING TOP OF BOX OF THE EXISTING 5'X9'RCB UNDERNEATH THE IH-10 WESTBOUND FRONTAGE ROAD, 72.67'.

6. THE 2-24" RCP OUTFALL, RUN 15, 33" RESTRICTOR, RUN 253, AND 36" POND OUTFALL, RUNS 110, 401 AND 402, WERE MODELED WITH EQUIVALENT PIPE SIZES TO MATCH HEAD LOSS OF 2D MODELED PIPES IN SYSTEM AB.

7. RUN 111 REPRESENTS IMPACT OF DETENTION BASIN. PEAK FLOW EXITS AT NODE AM38C (REDUCED BY -109.47CFS). THEN 60% OF PEAK FLOW (65.68CFS) RE-ENTERS AT A44, WHICH REPRESENTS THE THE 36"RCP OUTFALL OF THE BASIN.

NOTES:

1. SEE PAVEMENT AND STORM SEWER SHEETS FOR MORE INFORMATION.

2. ALL STORM SEWER LENGTHS ARE BASED ON CENTER OF STRUCTURE (HYDRAULIC LENGTH) EXCEPT AT BOX CULVERT LATERALS WHERE INSIDE EDGE OF BOX CULVERT OR JUNCTION BOX IS LIMIT OF PIPE.

3. COST FOR CONNECTION TO EXISTING STORM SEWERS WILL BE SUBSIDIARY TO STRUCTURE.

4. VERIFY LOCATION OF EXISTING UTILITIES PRIOR TO CONSTRUCTION.

5. ENGINEER OF RECORD HAS REVIEWED ALL THE WARNING MESSAGES AND THEY ARE ACCEPTABLE WITHIN THE COH GUIDELINES.

6. THE 2-24" RCP OUTFALL, RUN 15, 33" RESTRICTOR, RUN 253, AND 36" POND OUTFALL, RUNS 110, 401 AND 402, WERE MODELED WITH EQUIVALENT PIPE SIZES TO MATCH HEAD LOSS OF 2D MODELED PIPES IN SYSTEM AB.

NOTES:

1. THE TAILWATER USED FOR THE 100-YR ANALYSIS WAS 2-FT ABOVE THE TOP OF BOX (2-10'x10' CULVERTS DOWNSTREAM OF LUMPKIN ROAD). ACTUAL TAILWATERS FROM THE TXDOT IH-10 STUDY WERE REVIEWED, HOWEVER THE RELATIVELY HIGH ELEVATIONS WERE NOT REASONABLE TO EVALUATE HYDRAULICS VS. COH CRITERIA. THEREFORE THE OPTIONAL TAILWATER OF 2-FT ABOVE THE PIPE SOFFIT WAS USED AS PER COH "CONSIDERATIONS FOR CIP PROJECTS" GUIDELINES, NOVEMBER 2009.
2. HYDRAULIC DATA FROM INFOWORKS SD 2D MODEL
3. ALLOWABLE MPE BASED ON THE MINIMUM OF THE LOWEST ROW ELEVATION OR MAXIMUM PONDING DEPTHS AS PER CITY IDM 2013.
4. DRAINAGE SYSTEMS C, D, E, AND F SHOWN ON THE OVERALL DRAINAGE AREA MAPS DO NOT DRAIN DIRECTLY TO LUMPKIN SYSTEM HOWEVER WERE MODELED TO EVALUATE OVERLAND STORM FLOWS IN THE REGION. DATA FOR THESE IS NOT INCLUDED IN THIS TABLE FOR CLARITY.
5. SEE "LUMPKIN ROAD DRAINAGE IMPACT STUDY" MAY 2014 FOR A DISCUSSION OF THE HYDROLOGIC AND HYDRAULIC ANALYSIS.
6. PROPOSED WATER LEVEL INCREASE, BUT STILL BELOW ALLOWABLE MPE.

For structures with T6 traffic rail, refer to T6-CM standard. For structures with traffic rail, other than T6, refer to RAC standard.
2. For curbs less than 1'-0" high, tilt Bars K or reduce bar height as necessary to maintain cover. For curbs less than 3" high, Bars K may be omitted.
3. Curb, Wingwall or Safety End Treatment reinforcing shall extend into concrete closure. Any reinforcing that does not fit into the closure shall be bent or trimmed as necessary.
4. Cast-in-place concrete closure shall be 3'-0" min. Boxes shall be cast short or broken back in the field. All reinforcing in the closure shall be the same size and spacing as in the precast box section. Except where shown otherwise, the cast-in-place closure shall be flush with the inside and outside faces of the precast box section.
5. For multiple unit placements the length of the closure for the interior walls may be adjusted as necessary. The length of the top slab, bottom slab, and exterior wall closure shall not be less than 3'-0". See Section B-B detail when interior walls are cast full length.
6. Precast box reinforcing shall extend a minimum of 1'-0" into concrete closure (Typ).

WING DIMENSION CALCULATIONS:

Formulas: (All values are in Feet)

Hw = H + T + C
Lw = (Hw) (SL) ÷ Cosine θ for Ty PW-1
= (Hw - 1') (SL) ÷ Cosine θ for Ty PW-2 and Hw ≥ 4'
= (Hw - 0.5') (SL) ÷ Cosine θ for Ty PW-2 and Hw < 4'

For Cast-in-place culverts:
Ltw = [(N) (S) + (N + 1) (U)] ÷ Cosine θ

For Precast culverts:
Ltw = [(N) (2 U + S) + (N - 1) (0.5')] ÷ Cosine θ
Total Wingwall Area (Two Wings ~ SF)
= (2) (Hw) (Lw) for Ty PW-1
= (2) (Hw) (Lw) - 6 SF for Ty PW-2 and Hw ≥ 4'
= (2) (Hw) (Lw) - 1.5 SF for Ty PW-2 and Hw < 4'

Hw = Height of Wingwall
Lw = Length of Wingwall
Ltw = Culvert Toewall Length
N = Number of Culvert Spans
SL:1 = Channel Slope ratio. (Horizontal: 1 Vertical, Usual value is 2:1)
θ = Culvert Skew

See applicable box culvert standard for S, H, T and U values.

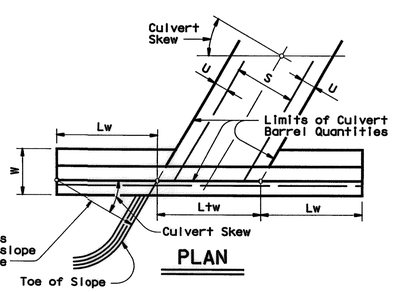
PLAN

DETAILS FOR NON-SKEWED BOX CULVERTS



PLAN

DETAILS FOR SKEWED BOX CULVERTS
(Showing 30° Skew)

① Skew Angle = 0°

② At discharge end, chamfer may be ¾".

③ For 15° Skew ~ 1"
For 30° Skew ~ 2"
For 45° Skew ~ 3"

④ Quantities shown are for two Type PW-1 wings. Adjust concrete volume for Type PW-2 wings. To determine estimated quantities for two wings, multiply the tabulated values by Lw. Quantities shown do not include weight of Bars D.

⑤ Provide weepholes for Hw = 5'-0" and greater. Fill around weepholes with coarse gravel.

⑥ Extend Bars E2 1'-6" minimum into the wingwall footing.

⑦ Lap Bars M1 1'-6" minimum with Bars M2.

⑧ Bars G equally spaced at 8" maximum, place as shown. Provide at least two pair Bars G per wing.

⑨ 0" min to 5'-0" max. Estimated curb heights are shown elsewhere in the plans. For structures with pedestrian rail, bicycle rail or curbs taller than 1'-0", refer to ECD standard. For structures with T6 bridge rail, refer to T6-CM standard. For structures with traffic rail, other than T6, refer to RAC standard.

⑩ For vehicle safety, the following requirements must be met:
- For structures without bridge rail, curbs cannot project more than 3" above finished grade.
- For structures with bridge rail, build curbs flush with finished grade.
Reduce curb heights, if necessary, to meet the above requirements. No changes will be made in quantities and no additional compensation will be allowed for this work.

⑪ 1'-0" typical. 2'-0" typical when RAC standard is referenced elsewhere in the plans.

⑫ 3'-0" for Hw < 4'.

⑬ 6" for Hw < 4'.

GENERAL NOTES:
Designed in accordance with AASHTO LRFD Bridge Design Specifications.
Provide Class "C" Concrete (f'c = 3,600 psi Min) and Grade 60 reinforcing steel.
Provide 1 ¼" Min clear cover to reinforcing steel.
Depth of toewalls for wingwalls and culverts may be reduced or eliminated when founded on solid rock, when directed by the Engineer.
See BCS sheet for wingwall type and additional dimensions and information.
The quantities for concrete and reinforcing steel resulting from the formulas given on this sheet are for the Contractor's information only.

DESIGNER NOTES:
Type PW-1 can be used for all applications and must be used if railing is to be mounted to the wingwall.
Type PW-2 can only be used for applications without a railing mounted to the wingwall.

AVALON 650 LED Specification

The AVALON offers clean, functional styling to blend with a broad range of architecture. Two sizes meet diverse proportional requirements. The cast aluminum housing with integrated pole top fitter anchors stainless steel rods to support the flat spun aluminum shade and cast top cap. The cylindrical clear acrylic lens extends through the shade forming an aperture to subtly highlight the luminaire night form. External louvers mimic the shade profile, while functioning to reduce brightness. Signature stepped pole with flush handhole and double welded transition is available in steel or aluminum. Steel pole is hot-dip galvanized prior to being finished in finely textured paint. Base cover is spun aluminum. All hardware is stainless steel. Standard colors; matte silver grey metallic or black. Special colors available.

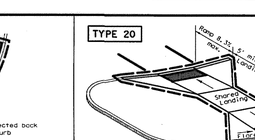
General Notes

Curb Ramps

1. Install a curb ramp or blended transition at each pedestrian street crossing.
2. All slopes shown are maximum allowable. Lesser slopes that will still drain properly should be used. Adjust curb ramp length or grade of approach sidewalks as directed.
3. The minimum sidewalk width is 5'. Where the sidewalk is adjacent to the back of curb, a 6' sidewalk width is desirable. Where a 5' sidewalk cannot be provided due to site constraints, sidewalk width may be reduced to 4' for short distances. 5'x 5' passing areas at intervals not to exceed 200' are required.
4. Landings shall be 5'x 5' minimum with a maximum 2% slope in any direction.
5. Maneuvering space at the bottom of curb ramps shall be a minimum of 4'x 4' wholly contained within the crosswalk and wholly outside the parallel vehicular travel path.
6. Maximum allowable cross slope on sidewalk and curb ramp surfaces is 2%.
7. Provide flared sides where the pedestrian circulation path crosses the curb ramp. Flared sides shall be sloped at 10% maximum, measured parallel to the curb. Returned curbs may be used only where pedestrians would not normally walk across the ramp, either because the adjacent surface is planted, substantially obstructed, or otherwise protected.
8. Additional information on curb ramp location, design, light reflective value and texture may be found in the current edition of the Texas Accessibility Standards (TAS) and 16 TAC 68.102.
9. To serve as a pedestrian refuge area, the median should be a minimum of 6' wide, measured from back of curbs. Medians should be designed to provide accessible passage over or through them.
10. Small channelization islands, which do not provide a minimum 5'x 5' landing at the top of curb ramps, shall be cut through level with the surface of the street.
11. Crosswalk dimensions, crosswalk markings and stop bar locations shall be as shown elsewhere in the plans. At intersections where crosswalk markings are not required, curb ramps shall align with theoretical crosswalks unless otherwise directed.
12. Handrails are not required on curb ramps. Provide curb ramps wherever an accessible route crosses (penetrates) a curb.
13. Curb ramps and landings shall be constructed and paid for in accordance with Item 531 "Sidewalks".
14. Place concrete at a minimum depth of 5" for ramps, flares and landings, unless otherwise directed.
15. Provide a smooth transition where the curb ramps connect to the street.
16. Curbs shown on sheet 1 within the limits of payment are considered part of the curb ramp for payment, whether it is a concrete curb, gutter, or combined curb and gutter.
17. Existing features that comply with TAS may remain in place unless otherwise shown on the plans.

Detectable Warning Material

18. Curb ramps must contain a detectable warning surface that consists of raised truncated domes complying with Section 705 of the TAS. The surface must contrast visually with adjoining surfaces, including side flares. Furnish and install an approved cast-in-place dark brown or dark red detectable warning surface material adjacent to uncolored concrete, unless specified elsewhere in the plans.
19. Detectable Warning Materials must meet TxDOT Departmental Materials Specification DMS 4358 and be listed on the Material Producer List. Install products in accordance with manufacturer's specifications.
20. Detectable warning surfaces must be slip resistant and not allow water to accumulate.
21. Detectable warning surfaces shall be a minimum of 24" in depth in the direction of pedestrian travel, and extend the full width of the curb ramp or landing where the pedestrian access route enters the street.
22. Detectable warning surfaces shall be located so that the edge nearest the curb line is at the back of curb. Align the rows of domes to be perpendicular to the grade break between the ramp run and the street. Detectable warning surfaces may be curved along the corner radius.
23. Shaded areas on Sheet 1 of 4 indicate the approximate location for the detectable warning surface for each curb ramp type.



PERPENDICULAR CURB RAMP

Typical placement of detectable warning surface on sloping ramp run.

DIRECTIONAL CURB RAMP

Typical placement of detectable warning surface on sloping ramp run.

SECTION: CURB RAMP AT DETECTABLE WARNING

PARALLEL CURB RAMP

Typical placement of detectable warning surface on landing at street edge.

DETECTABLE WARNINGS

Detectable Warning Pavers

24. Furnish detectable warning paver units meeting all requirements of ASTM C-936, C-33. Lay in a two by two unit basket weave pattern or as directed.
25. Lay full-size units first followed by closure units consisting of at least 25 percent of a full unit. Cut detectable warning paver units using a power saw.

Sidewalks

26. Provide clear ground space at operable parts, including pedestrian push buttons. Operable parts shall be placed within one or more reach ranges specified in TAS 308.
27. Place traffic signal or illumination poles, ground boxes, controller boxes, signs, drainage facilities and other items so as not to obstruct the pedestrian access route or clear ground space.
28. Street grades and cross slopes shall be as shown elsewhere in the plans.
29. Changes in level greater than 1/4 inch are not permitted.
30. The least possible grade should be used to maximize accessibility. The running slope of sidewalks and crosswalks within the public right of way may follow the grade of the parallel roadway. Where a contanuous grade greater than 5% must be provided, handrails may be desirable to improve accessibility. Handrails may also be needed to protect pedestrians from potentially hazardous conditions. If provided, handrails shall comply with TAS 505.
31. Handrail extensions shall not protrude into the usable landing area or into intersecting pedestrian routes.
32. Driveways and turnouts shall be constructed and paid for in accordance with Item "Intersections, Driveways and Turnouts". Sidewalks shall be constructed and paid for in accordance with Item "Sidewalks".
33. Sidewalk details are shown elsewhere in the plans.

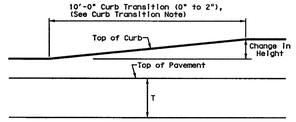
Curb Transition Note:
Field conditions may require a longer or shorter transition, and shall be shown elsewhere in the plans, or as directed by the Engineer.



CURB TRANSITION
Note: To be paid for as Highest Curb

General Notes

1. All materials and construction shall be in accordance with Item 529, "Concrete Curb, Gutter, and Combined Curb and Gutter."
2. Concrete shall be Class A.
3. When reinforcing bars are used, they shall be No.4 unless otherwise shown. The use of synthetic fiber in lieu of steel reinforcing is acceptable, provided the fiber producer is on the Department Producer List (WPL), maintained by TxDOT, Construction Division.
4. Round exposed sharp edges with a rounding tool, to a minimum radius of ½inch.
5. All existing curbs and driveways to be removed shall be sawed or removed at existing joints.
6. Where concrete curb is placed on existing concrete pavement, the pavement shall be drilled and the reinforcing bars grouted in place.
7. Expansion and contraction joints shall be constructed to match pavement joints in all curbs and curb and gutter adjacent to jointed concrete pavement. Where placement of curb or curb and gutter is not adjacent to concrete pavement, expansion joints shall be provided at structures, curb returns at streets, and at locations directed by The Engineer.
8. Vertical and horizontal dowel bars and transverse reinforcing bars shall be placed at four feet C-C.
9. Dimension 'T' shown is the thickness of concrete pavement. When curb is installed adjacent to flexible pavement dimension 'T' is 8" maximum.
10. Usual profile grade line. Refer to typical sections and plan-profile sheets for exact locations.
11. One-half inch expansion joint material shall be provided where curb or curb and gutter is adjacent to sidewalk or riprap.
12. When vertical permissible construction joints are used, resulting in a longitudinal construction joint in the pavement, the longitudinal pavement steel shall be placed in accordance with pavement details shown elsewhere in the plans for longitudinal construction joints. Reinforcing steel for curb section shall then conform to that required for concrete curb.

GENERAL NOTES

1. Flags attached to signs where shown, are REQUIRED.
2. All traffic control devices illustrated are REQUIRED, except those denoted with the triangle symbol may be omitted when stated elsewhere in the plans, or for routine maintenance work, when approved by the Engineer.
3. A Shadow Vehicle with a TMA should be used anytime it can be positioned 30 to 100 feet in advance of the area of crew exposure without adversely affecting the performance or quality of the work. If workers are no longer present but road or work conditions require the traffic control to remain in place, Type 3 Barricades or other channelizing devices may be substituted for the Shadow Vehicle and TMA.
4. Additional Shadow Vehicles with TMAs may be positioned in each closed lane, on the shoulder or off the paved surface, next to those shown in order to protect a wider work space.
5. The downstream taper is optional. When used, it should be 100 feet approximately per lane, with channelizing devices spaced at 20 feet.

TCP (2-5a)

6. If this TCP is used for a left lane closure, CW20-5TL "LEFT LANE CLOSED" signs shall be used and channelizing devices shall be placed on the centerline to protect the work space from opposing traffic, with the arrow board placed in the closed lane near the end of the merging taper.

TCP (2-5b)

7. Conflicting pavement markings shall be removed for long-term projects.

For construction or maintenance contract work, specific project requirements for shadow vehicles can be found in the project GENERAL NOTES for Item 502, Barricades, Signs and Traffic Handling.
